

FLIGHTING

The spiral screw that wraps around a solid shaft is called the auger flight. It can be hollow, or a solid welded piece that attaches to a pipe, tube or solid bar. The only exception is in a feeder type application in which case it does not have to connect. Flighting is used in multiple types of configurations and depending on the flow characteristics of the product, different types of bars may be used such as round, flat or beveled bar.

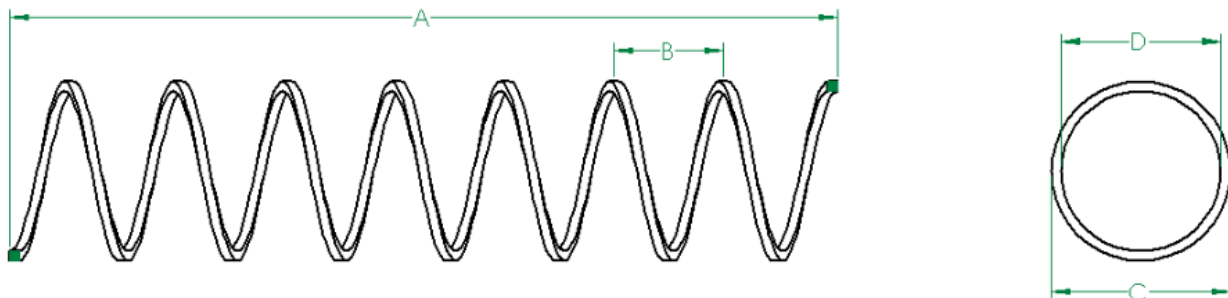

Dimensions & Specifications

- A Overall Length: _____
- B Pitch: _____
- C Thickness: _____
- D Inside Diameter: _____
- E Outside Diameter: _____
